<p>(54) Title: AGENT FOR REGULATING THE GREASINESS OF THE SKIN</p> <div style="text-align: center; margin: 20px 0;"> <p>The chemical structure (cis)-(I) consists of a pyrazole ring connected via its nitrogen atom to a carbon atom. This carbon atom is also bonded to a chlorine atom and an oxygen atom. The oxygen atom is part of a five-membered cyclic acetal structure fused to a benzene ring. This benzene ring has two chlorine atoms at the 3 and 5 positions. The benzene ring is connected via a methylene group (-CH2-) to an ether linkage (-O-), which is further connected to another benzene ring. This second benzene ring is attached to a piperidine ring, which is in turn connected to a carbonyl group (-C(=O)-). The carbonyl group is bonded to an oxygen atom, which is connected to an 'R' group. The stereochemistry is indicated as (cis)-(I).</p> </div> <p>(57) Abstract</p> <p>The use of a compound having formula ((cis)-(I)), wherein R represents methyl or ethyl, for regulating the greasiness of the skin, particular novel physical forms of said compound, cosmetic compositions comprising said agent, processes for preparing said agent and compositions, and a method of reducing the greasiness of the skin.</p>
